

Easily Protect Your Health From Arsenic and Heavy Metals

Treatment Unit Description

Canyon State Filtration is proud to introduce the newest and most advanced line of water treatment systems for residential customers. As the premier distributor of MetSorb HMRG filtration media, Canyon State Filtration is offering a water treatment solution to residential users, which can also be used by commercial customers and for environmental remediation projects. MetSorb HMRG is specifically designed to treat arsenic, antimony, cadmium, copper, chromium, lead, mercury, uranium, zinc and selenium.

These compact water treatment systems utilize the same treatment technology found at large-scale water treatment plants serving cities and towns.

The adsorptive titanium-based media is a leading technology in the water treatment process and is superior than other products that are iron-based.

It is important to note that titanium does not require the injection of chlorine into water like iron does since iron is a known source of bacteria.

Advantages:

- Plug-and-play units arrive ready to be installed
- Automatic controls are simple and easy to use
- Long-lasting with proven performance
- Trusted by municipalities worldwide
